Download . Download . And then do some styling in Gimp, I found this tutorial to be very helpful: If you have any questions, do ask! Q: How would a battery state of charge affect testing a gas engine? My car is equipped with a Smart gas engine. What I'm wanting to do is figure out how to test it. I haven't found much information on this and none that I've seen are conclusive for my purpose. I want to simply see if it performs as expected, I'm not interested in testing it's accuracy. I can see in the manual that the battery state of charge can affect the engine's fuel/air mixture and thus the performance, but it's not very clear. I'm interested in doing this in an indoor venue. I suppose the first question to ask is, does my car's battery state of charge impact the performance of the car? I assume that if it does and it's not uncommon for a gas engine, then the real question is, how would I test it without causing it to have a different battery state of charge? A: The manual doesn't say that this would affect the fuel mixture. The engine control unit monitors the state of charge of the battery. It does this by applying a constant current to the battery. If that current is above a certain value the engine control unit will use an enriched fuel mixture. If the battery state of charge is below this point the engine control unit will apply a leaner fuel mixture. The battery state of charge is actually very important for the engine control unit. Without the constant current it wouldn't know if the battery is fully charged, partially charged or discharged. If the state of charge is very low you would get a not enough power warning. If the state of charge is very high you could get a over voltage warning. The difference in battery state of charge affects the performance of the engine as a whole. A high battery state of charge will increase the power output. A low battery state of charge will reduce the maximum power output. What you are looking for is actually very complicated and has little to do with the battery state of charge. How much this changes depends on a whole lot of factors. The engine is complex. If you want to test a gas engine, you will need to build a lot of equipment to test
